# The Cognitive Style of PowerPoint

*"Not waving but drowning."* Stevie Smith

IN corporate and government bureaucracies, the standard method for making a presentation is to talk about a list of points organized onto slides projected up on the wall. For many years, overhead projectors lit up transparencies, and slide projectors showed high-resolution 35mm slides. Now "slideware" computer programs for presentations are nearly everywhere. Early in the 21st century, several hundred million copies of Microsoft PowerPoint were turning out trillions of slides each year.

Alas, slideware often reduces the analytical quality of presentations. In particular, the popular PowerPoint templates (ready-made designs) usually weaken verbal and spatial reasoning, and almost always corrupt statistical analysis. What is the problem with PowerPoint? And how can we improve our presentations?

When Louis Gerstner became president of IBM, he encountered a big company caught up in ritualistic slideware-style presentations:

One of the first meetings I asked for was briefing on the state of the [main-frame computer] business. I remember at least two things about that first meeting with Nick Donofrio, who was then running the System/390 business. One is that I . . . experienced a repeat of my first day on the job. Once again, I found myself lacking a badge to open the doors at the complex, which housed the staffs of all of IBM's major product groups, and nobody there knew who I was. I finally persuaded a kind soul to let me in, found Nick, and we got started. Sort of.

At that time, the standard format of any important IBM meeting was a presentation using overhead projectors and graphics that IBMers called "foils" [projected transparencies]. Nick was on his second foil when I stepped to the table and, as politely as I could in front of his team, switched off the projector. After a long moment of awkward silence, I simply said, "Let's just talk about your business."

I mention this episode because it had an unintended, but terribly powerful ripple effect. By that afternoon an e-mail about my hitting the Off button on the overhead projector was crisscrossing the world. Talk about consternation! It was as if the President of the United States had banned the use of English at White House meetings.<sup>1</sup>

<sup>1</sup> Louis V. Gerstner, Jr., *Who Says Elephants Can't Dance? Inside IBM's Historic Turn-around* (2002), p. 43.

There is a lot going on here: the humiliation ceremony authorizing entry into the Corporate Palace, a new president symbolically demonstrating that things were going to be different from now on, and a blunt action indicating that there might be better ways to do serious analysis than reading aloud from projected lists—*"Let's just talk about your business."*

1085 487 01

## The Cognitive Style of PowerPoint

Gerstner's idea, "*Let's just talk about your business,*" means an exchange of information, an interplay between speaker and audience. Yet PowerPoint is entirely *presenter-oriented*, and *not content-oriented*, *not audience-oriented*. The claims of PP marketing are addressed to speakers: "A cure for the presentation jitters." "Get yourself organized." "Use the AutoContent Wizard to figure out what you want to say." The fans of PowerPoint are presenters, rarely audience members.

Slideware helps speakers to outline their talks, to retrieve and show diverse visual materials, and to communicate slides in talks, printed reports, and internet. And also to replace serious analysis with chartjunk, over-produced layouts, cheerleader logotypes and branding, and corny clip art. That is, PowerPointPhluff.

PP convenience for the speaker can be costly to both content and audience. These costs result from the *cognitive style characteristic of the standard default PP presentation*: foreshortening of evidence and thought, low spatial resolution, a deeply hierarchical single-path structure as the model for organizing every type of content, breaking up narrative and data into slides and minimal fragments, rapid temporal sequencing of thin information rather than focused spatial analysis, conspicuous decoration and Phluff, a preoccupation with format not content, an attitude of commercialism that turns everything into a sales pitch.

## Extremely Low Resolution of PowerPoint

PP slides projected up on the wall are very low resolution—compared to paper, 35mm slides, and the immensely greater capacities of the human eye-brain system. Impoverished space leads to over-generalizations, imprecise statements, slogans, lightweight evidence, abrupt and thinly-argued claims. For example, this slide from a statistics course shows a seriously incomplete statement. Probably the *shortest true statement* that can be made about causality and correlation is "*Empirically observed covariation is a necessary but not sufficient condition for causality.*" Or perhaps "*Correlation is not causation but it sure is a hint.*" Many true statements are too long to fit on a PP slide, but this does not mean we should abbreviate the truth to make the words fit. It means we should find a better way to make presentations.

With so little information per slide, many many slides are needed. Audiences consequently endure a relentless sequentiality, one damn slide after another. When information is stacked in time, it is difficult to understand context and evaluate relationships. Visual reasoning usually works more effectively when the relevant information is shown adjacent in space within our eyespan. This is especially the case for statistical data, where the fundamental analytical act is to make comparisons.

The statistical graphics generated by the PowerPoint ready-made templates are astonishingly thin, nearly content-free. In 28 books on PP presentations, the 217 data graphics depict an average of 12 numbers each. Compared to the worldwide publications shown in the table at right, the statistical graphics based on PP templates are the thinnest of all, except for those in *Pravda* back in 1982, when that newspaper operated as the major propaganda instrument of the Soviet communist party and a totalitarian government. Doing a bit better than *Pravda* is not good enough. Data graphics based on PP templates show 10% to 20% of the information found in routine news graphics. The appropriate response to such vacuous displays is for people in the audience to speak out: “It’s more complicated than that!” “Why are we having this meeting? The rate of information transfer is asymptotically approaching zero.”

### *Bullet Outlines Dilute Thought*

Impoverished resolution coerces slide-makers into using the compressed language of presentations—the *bullet list* of brief phrases. Bullets, little marks sometimes decorative or cute, signal the beginning of each phrase for those unable to recognize it. Sometimes the bullet hierarchies are so complex and intensely nested that they resemble computer code.

By insisting that points be placed in an orderly structure, the bullet list may help extremely disorganized speakers get themselves organized. The bullet list is surely the most widely used format in corporate and government presentations. Bullets show up in many paper reports, as presenters simply print out their PP slides.

For the naive, bullet lists may create the appearance of hard-headed organized thought. But in the reality of day-to-day practice, the PP cognitive style is faux-analytical. A study in the *Harvard Business Review* found generic, superficial, simplistic thinking in the bullet lists widely used in business planning and corporate strategy. What the authors are saying here, in the *Review*’s earnestly diplomatic language, is that bullet outlines can make us stupid:

In every company we know, planning follows the standard format of the bullet outline. . . . [But] bullet lists encourage us to be lazy in three specific, and related ways.

**Bullet lists are typically too generic.** They offer a series of things to do that could apply to any business. . . .

**Bullets leave critical relationships unspecified.** Lists can communicate only three logical relationships: sequence (first to last in time); priority (least to most important or vice versa); or simple membership in a set (these items relate to one another in some way, but the nature of that relationship remains unstated). And a list can show only one of those relationships at a time.<sup>2</sup>

MEDIAN NUMBER OF ENTRIES IN DATA MATRICES FOR STATISTICAL GRAPHICS IN VARIOUS PUBLICATIONS, 2003

<i>Science</i>	> 1,000
<i>Nature</i>	> 700
<i>New York Times</i>	120
<i>Wall Street Journal</i>	112
<i>Frankfurter Allgemeine Zeitung</i>	98
<i>New England Journal of Medicine</i>	53
<i>The Lancet</i>	46
<i>Asahi</i>	40
<i>Financial Times</i>	40
<i>Time</i>	37
<i>The Economist</i>	32
<i>Le Monde</i>	28
28 textbooks on PowerPoint presentations (1997–2003)	12
<i>Pravda</i> (1982)	5

Here is a graphic from *Pravda* (May 24, 1982), in the low-content, high-Phluff style now emulated by PP templates:

Additional evidence on data matrices for various publications, including *Pravda*, is reported in Edward R. Tufte, *The Visual Display of Quantitative Information* (1983, 2001), p. 167. In this table above, the medians are based on at least 20 statistical graphics and at least one full issue of each publication. Except for scientific journals, most of these publications use standard formats issue after issue; replications of several of the counts above were within 10% of the original result.

<sup>2</sup> Gordon Shaw, Robert Brown, Philip Bromiley, “Strategic Stories: How 3M is Rewriting Business Planning,” *Harvard Business Review*, 76 (May–June, 1998), pp. 42–44.

By leaving out the narrative between the points, the bullet outline ignores and conceals the causal assumptions and analytic structure of the reasoning. In their *Harvard Business Review* paper on business planning, Shaw, Brown, and Bromiley show that even simple one-way causal models are vague and unspecified in bullet outlines. And more realistic multivariate models with feedback loops and simultaneity are way over the head of the simplistic bullets:

Bullets leave critical assumptions about how the business works unstated. Consider these major objectives from a standard five-year strategic plan:

- Increase market share by 25%.
- Increase profits by 30%.
- Increase new-product introductions to ten a year.

Implicit in this plan is a complex but unexplained vision of the organization, the market, and the customer. However, we cannot extrapolate that vision from the bullet list. The plan does not tell us how these objectives tie together and, in fact, many radically different strategies could be represented by these three simple points. Does improved marketing increase market share, which results in increased profits (perhaps from economies of scale), thus providing funds for increased new-product development?

Market share → Profits → New-product development

Or maybe new-product development will result in both increased profits and market share at once:

New-product development → Market share  
New-product development → Profits

Alternatively, perhaps windfall profits will let us just buy market share by stepping up advertising and new-product development:

Profits → New-product development → Market share<sup>3</sup>

Bullet outlines might be useful in presentations now and then, but sentences with subjects and verbs are usually better. Instead of this type of soft, generic point found in many business plans

✓ **Accelerate the introduction of new products!**

it would be better to say *who* might do it and *how*, *when*, and *where* they might do it. Then several sentences together in a row, a *narrative*, could spell out the specific methods and processes by which the generic feel-good goals of mission statements might be achieved. Presentations for strategic planning might go beyond the words in lists and sentences by using annotated diagrams, images, sketches of causal models, equations, tables of numbers, and multivariate evidence.

<sup>3</sup> Gordon Shaw, Robert Brown, Philip Bromiley, "Strategic Stories: How 3M is Rewriting Business Planning," *Harvard Business Review*, 76 (May-June, 1998), p. 44. ©1998 Harvard Business School Publishing Corporation, all rights reserved.

As in corporate planning, bullet outlines are also far from the optimal format for scientific and engineering analysis. Indeed such outlines may well be pessimal.

Our evidence begins with a case study of 3 PowerPoint presentations directed to NASA officials who were making some important decisions during the final flight of the space shuttle Columbia. Those presentations contained several intellectual failures in engineering analysis. In addition, the cognitive style of PP compromised the analysis. Furthermore, the PP damage to these presentations turns out to reflect *widespread* problems in technical communication by means of PP, according to the final report of the Columbia Accident Investigation Board.

During the spaceflight of the shuttle Columbia in January 2003, Boeing Corporation engineers prepared 3 quick reports assessing possible damage to the left wing resulting from the impact of several chunks of debris 81 seconds after liftoff.<sup>4</sup> Although the evidence is uncertain and thin, the logical structure of the engineering analysis is straightforward:

debris kinetic energy  
(function of mass,  
velocity, and angle  
of incidence) + debris hits locations  
of varying vulnerability  
on left wing → level of threat to the  
Columbia during  
re-entry heating  
of wing

The Columbia Accident Investigation Board found that the reports unfortunately provided an over-optimistic assessment of the danger facing the damaged Columbia as it orbited. All 3 reports have standard PP format problems: elaborate bullet outlines; segregation of words and numbers (12 of 14 slides with quantitative data have no accompanying analysis); atrocious typography; data imprisoned in tables by thick nets of spreadsheet grids; only 10 to 20 short lines of text per slide.

And now, on the next page, let us take a close look at the key slide in the Boeing PowerPoint reports on the Columbia.

<sup>4</sup> Carlos Ortiz, Arturo Green, Jack McClymonds, Jeff Stone, Abdi Khodadoust, "Preliminary Debris Transport Assessment of Debris Impacting Orbiter Lower Surface in STS-107 Mission," January 24, 2003; P. Parker, D. Chao, I. Norman, M. Dunham, "Orbiter Assessment of STS-107 ET Bipod Insulation Ramp Impact," January 23, 2003; Carlos Ortiz, "Debris Transport Assessment of Debris Impacting Orbiter Lower Surface in STS-107 Mission," January 24, 2003. The Boeing reports are published in official records of the Columbia investigation.

## Summary and Conclusion

- **Impact analysis ("Crater") indicates potential for large TPS damage**
  - ~ Review of test data shows wide variation in Impact response
  - ~ RCC damage limited to coating based on soft SOFI
- **Thermal analysis of wing with missing tile is in work**
  - ~ Single tile missing shows local structural damage is possible, but no burn through
  - ~ Multiple tile missing analysis is on-going
- **M/OD criteria used to assess structural impacts of tile loss**
  - ~ Allows significant temperature exceedance, even some burn through
    - Impact to vehicle turnaround possible, but maintains safe return capability

## Conclusion

- Contingent on multiple tile loss thermal analysis showing no violation of M/OD criteria, safe return indicated even with significant tile damage

BOEING

13

### Results of Impact Analysis for particle size = 20" x 10" x 6"

[illegible]<sup>a</sup> 8 (5–10) Definite Impinging Ocular Wink.

On this single Columbia slide, in a PowerPoint festival of bureaucratic hyper-rationalism, 6 different levels of hierarchy are used to classify, prioritize, and display 11 simple sentences:

- Level 1 Title of Slide
- Level 2 ● Very Big Bullet
- Level 3 — dash
- Level 4 ♦ diamond
- Level 5 • little bullet
- Level 6 ( ) parentheses ending level 5

The analysis begins with the dreaded “Executive Summary.” A conclusion is presented as a headline title: “Test Data Indicates Conservatism for Tile Penetration.” This turns out to be unmerited reassurance. Executives, at least those who don’t want to get fooled, had better read far beyond the title.

The “conservatism” is *not* about the predicted tile damage but rather about the *choice of models* that might be used to predict damage! But why, after 112 flights, are models being calibrated during a crisis? How can “conservatism” be inferred from a loose comparison of a computer model and some thin data? Divergent evidence means divergent evidence, not inferential security. Claims of analytic “conservatism” should be viewed with skepticism. Such claims are sometimes a rhetorical tactic that substitutes verbal fudge factors for quantitative assessments.

As the analysis continues, the seemingly reassuring conclusion of the headline fades away.

These lower-level bullets at the end of the slide reveal that the headline conclusion is irrelevant and diverting. This third-level point notes that “Flight condition [that is, the Columbia] is significantly outside of test database.” How far outside? The final bullet will tell us.

This fourth-level bullet concluding the slide says that, by the way, the debris that struck the Columbia is estimated to be  $1920/3 = 640$  times larger than data used in the tests of the model! Thus a better headline would be “Review of Test Data Indicates Irrelevance of Two Models.” There is an interesting dynamic to this slide: the headline is an exercise in misdirection, which the text then awkwardly and slowly eviscerates.

The Very-Big-Bullet sentence does not seem to make sense.

Spray On Foam Insulation

## Review of Test Data Indicates Conservatism for Tile Penetration

- The existing SOFI on tile that was reviewed along with Spray On Foam Insulation
  - Crater overpredicted penetration significantly
    - ♦ Initial penetration to debris (3cu. In)
      - Varies with volume
    - ♦ Significant energy is required to penetrate the relative
      - Test results do show and velocity
    - ♦ Conversely, once tile is damaged significant damage
      - Minor variations in can cause significant
  - Flight condition is significantly outside of test database
    - ♦ Volume of ramp is 1920/3 = 640 times larger than data used in the tests of the model

A reference to a foam insulation piece that separated from the bipod ramp tying the orbiter to the large liquid fuel tank. Instead of “ramp,” say “estimated volume of one of several pieces of debris that might have damaged the wing.”

A model to estimate damage to the tiles protecting the left wing

## ates Conservatism for Tile ation

6

The vaguely quantitative words “significant” and “significantly” are used 5 times on this slide, with *de facto* meanings ranging from “detectable in largely irrelevant calibration case study” to “an amount of damage so that everyone dies” to “a difference of 640-fold.” None of these 5 usages appears to refer to the technical meaning of “statistical significance.”

The low resolution of PowerPoint slides promotes the use of compressed phrases like “Tile Penetration.” As is the case here, such phrases may well be ambiguous. The low resolution and large font generate 3 typographic orphans, lonely words dangling on a separate line:

**Penetration significantly 3cu. In**

?

This vague pronoun reference “it” alludes to *damage to the left wing*, which caused the destruction of the Columbia. The slide weakens important material with ambiguous language (sentence fragments, passive voice, multiple meanings of “significant”). The 3 reports were created by engineers for high-level NASA officials who were deciding whether the threat of wing damage required further investigation before the Columbia attempted to return. Satisfied that the reports indicated that the Columbia was not in danger, the officials made no further attempts to assess the threat. The slides were part of an oral presentation, later circulated as e-mail attachments.

In this slide the same unit of measure for volume (cubic inches) is shown a different way every time

**3cu. In 1920cu in 3 cu in**

rather than in clear and tidy exponential form  $1920 \text{ in}^3$ .

Perhaps the available font cannot show exponents.

Shakiness in conventions for units of measurement should provoke concern.\* Slides with hierarchical bullet-outlines do not handle statistical data and scientific notation gracefully. If PowerPoint is a corporate-mandated format for all engineering reports, then some competent scientific typography (rather than the PP market-pitch style) is essential. In this slide, the typography is so choppy and clunky that it impedes understanding.

\*In their final report (p. 191), the Columbia Accident Investigation Board developed this point about units of measurement: “While such inconsistencies might seem minor, in highly technical fields like aerospace engineering a misplaced decimal point or mistaken unit of measurement can easily engender inconsistencies and inaccuracies.”

Richard Feynman had also experienced the bullet-outline format style of NASA in his service on the commission that investigated the first shuttle accident, the Challenger in 1986. Feynman wrote:

Then we learned about “bullets”—little black circles in front of phrases that were supposed to summarize things. There was one after another of these little goddamn bullets in our briefing books and on slides.<sup>6</sup>

<sup>6</sup> Richard P. Feynman, *What Do You Care What Other People Think?* (New York, 1988), pp. 126–127.

For some scientists and engineers, Feynman might serve as the decisive authority on this matter. Indeed, for those who have read Feynman’s books, a good way to try to think clearly about evidence and explanation is to ask “What would Feynman do?”

The analysis of the key Columbia slide (shown here on pages 8–9) was posted at my website in March 2003.<sup>7</sup> Nearly all this material was then included by the Columbia Accident Investigation Board in their final report published in August 2003. In a section called “Engineering by Viewgraphs,” the Board went quite beyond my case study of the key PP slide with these extraordinary remarks:

<sup>7</sup> “Columbia Evidence—Analysis of Key Slide,” March 18, 2003, Ask E.T. Forum, [www.edwardtufte.com](http://www.edwardtufte.com)

As information gets passed up an organization hierarchy, from people who do analysis to mid-level managers to high-level leadership, key explanations and supporting information is filtered out. In this context, it is easy to understand how a senior manager might read this PowerPoint slide and not realize that it addresses a life-threatening situation.

At many points during its investigation, the Board was surprised to receive similar presentation slides from NASA officials in place of technical reports. The Board views the endemic use of PowerPoint briefing slides instead of technical papers as an illustration of the problematic methods of technical communication at NASA.<sup>8</sup>

<sup>8</sup> Columbia Accident Investigation Board, *Report*, volume 1 (August 2003), p. 191.

Clearly the Board had their fill of lightweight PP presentations!

For the Boeing PowerPoint reports and for the many PP presentations by NASA to the Board, the hierarchical bullet-outline failed to bring clarity, focus, or credibility to the presentations. On the contrary, the argument and evidence appeared broken up into small, arbitrary and misleading fragments.

And the *Harvard Business Review* study of corporate planning found that the widely used bullet outlines did not bring intellectual discipline to planning—instead the bullets accommodated the generic, superficial, and simplistic.

PowerPoint will not do for serious presentations. Serious problems require serious tools. Indeed, presenters may instantly damage their credibility by using PP for serious problems—as was the case for the NASA officials with their PP pitches and PP decks so naively presented to the very serious Columbia Accident Investigation Board.

### *High-Resolution Visual Channels Are Compromised by PowerPoint*

A talk, which proceeds at a pace of 100 to 160 spoken words per minute, is not an especially high resolution method of data transmission. Rates of transmitting *visual* evidence can be far higher. The artist Ad Reinhardt said, "As for a picture, if it isn't worth a thousand words, the hell with it." People can quickly look over tables with hundreds of numbers in, say, financial or sports pages in newspapers. People read 300 to 1,000 printed words a minute, and find their way around a printed map or a 35mm slide displaying 5 to 40 MB in the visual field. Often the visual channel is an intensely high-resolution channel.

Yet, in a strange reversal, nearly all PowerPoint slides that accompany talks have much *lower* rates of information transmission than the talk itself. Too often the images are content-free clip art, the statistical graphics don't show data, and the text is grossly impoverished. As shown in this table, *the PowerPoint slide typically shows 40 words, which is about 8 seconds-worth of silent reading material*. The slides in PP textbooks are particularly disturbing: in 28 textbooks, which should use only first-rate examples, the median number of words per slide is 15, worthy of billboards, about 3 or 4 seconds of silent reading material.

This poverty of content has several sources. First, *the PP design style*, which typically uses only about 30% to 40% of the space available on a slide to show unique content, with all remaining space devoted to Phluff, bullets, frames, and branding. Second, *the slide projection of text*, which requires very large type so the audience can read the words. Third, *presenters who don't have all that much to say* (for example, among the 2,140 slides reported in our table, the really lightweight slides are found in the presentations made by educational administrators).

A vicious circle results. Thin content leads to boring presentations. To make them uninteresting, PP Phluff is added, damaging the content, making the presentation even more boring, requiring more Phluff . . .

What to do? For serious presentations, it will be useful to replace PowerPoint slides with paper handouts showing words, numbers, data graphics, images together. High-resolution handouts allow viewers to contextualize, compare, narrate, and recast evidence. In contrast, data-thin, forgetful displays tend to make audiences ignorant and passive, and also to diminish the credibility of the presenter. Thin visual content prompts suspicions: "What are they leaving out? Is that all they know? Does the speaker think we're stupid?" "What are they hiding?" Sometimes PowerPoint's low resolution is said to promote a clarity of reading and thinking. Yet in visual reasoning, art, typography, cartography, even sculpture, *the quantity of detail is an issue completely separate from the difficulty of reading*.<sup>9</sup> Indeed, at times, the more intense the detail, the greater the clarity and understanding—because meaning and reasoning are *contextual*. Less is a bore.

#### WORDS ON TEXT-ONLY POWERPOINT SLIDES

26 slides in the 3 Columbia reports by Boeing, median number of words per slide	97
1,460 text-only slides in 189 PP reports posted on the internet and top-ranked by Google, March 2003, median number of words per slide	40
654 slides in 28 PowerPoint textbooks, published 1997-2003, median number of words per slide	15

<sup>9</sup> Edward R. Tufte, *Envisioning Information* (1990), pp. 36-51.

## Metaphors for Presentations

Years before today's slideware, presentations at companies such as IBM and in the military used bullet lists shown by overhead projectors. Then, in 1984, a software house developed a presentation package, "Presenter," which was eventually acquired by Microsoft and turned into PowerPoint.

This history is revealing, for the metaphor behind the PP cognitive style is *the software corporation itself*. That is, a big bureaucracy engaged in *computer programming* (deeply hierarchical, nested, highly structured, relentlessly sequential, one-short-line-at-a-time) and in *marketing* (fast pace, misdirection, advocacy not analysis, slogan thinking, branding, exaggerated claims, marketplace ethics). *To describe a software house is to describe the PowerPoint cognitive style*. Why should the structure, activities, and values of a large commercial bureaucracy be a useful metaphor for our presentations? Could any metaphor be worse? Voice-mail menu systems? Billboards? Television? Stalin?

The pushy PP style imposes itself on the audience and, at times, seeks to set up a dominance relationship between speaker and audience. The speaker, after all, is making *power points with bullets to followers*. Such aggressive, stereotyped, over-managed presentations—the Great Leader up on the pedestal—are characteristic of hegemonic systems:

The Roman state bolstered its authority and legitimacy with the trappings of ceremony. . . . Power is a far more complex and mysterious quality than any apparently simple manifestation of it would appear. It is as much a matter of impression, of theatre, of persuading those over whom authority is wielded to collude in their subjugation. Insofar as power is a matter of presentation, its cultural currency in antiquity (and still today) was the creation, manipulation, and display of images. In the propagation of the imperial office, at any rate, art was power.<sup>10</sup>

A better metaphor for presentations is *good teaching*.<sup>11</sup> Teachers seek to explain something with credibility, which is what many presentations are trying to do. The core ideas of teaching—*explanation, reasoning, finding things out, questioning, content, evidence, credible authority not patronizing authoritarianism*—are contrary to the hierarchical market-pitch approach.

Especially disturbing is the introduction of the PowerPoint cognitive style into schools. Instead of writing a report using sentences, children learn how to make client pitches and info-mercials, which is better than encouraging children to smoke. Elementary school PP exercises (as seen in teacher's guides, and in student work posted on the internet) typically show 10 to 20 words and a piece of clip art on each slide in a presentation consisting of 3 to 6 slides—a total of perhaps 80 words (15 seconds of silent reading) for a week of work. Rather than being trained as mini-bureaucrats in PPPhluff and foreshortening of thought, students would be better off if the schools simply closed down on those days and everyone went to The Exploratorium. Or wrote an illustrated essay explaining something.

<sup>10</sup> Jás Elsner, *Imperial Rome and Christian Triumph: The Art of the Roman Empire AD 100-450* (1998), p. 53.

<sup>11</sup> For various and sometimes divergent ideas about teaching and presentations, see Joseph Lowman, *Mastering the Techniques of Teaching* (1995); Wilbert J. McKeachie and Barbara K. Hofer, *McKeachie's Teaching Tips* (2001); Frederick Mosteller, "Classroom and Platform Performance," *The American Statistician*, 34 (February 1980), 11-17 (posted at [www.edwardtufte.com](http://www.edwardtufte.com)); and Edward R. Tufte, *Visual Explanations* (1997), pp. 68-71.

### *The Gettysburg PowerPoint Presentation*

The PP cognitive style is so distinctive and peculiar that presentations relying on standard ready-made templates sometimes appear as over-the-top parodies instead of the sad realities they are. Here is an intentional and ferocious parody: imagine Abraham Lincoln had used PowerPoint at Gettysburg. . . .

*Um, my name is Abraham Lincoln and, um, I have to reboot . . . .*

*As we see in the Organizational Overview slide, four score and seven years ago our fathers brought forth on this continent a new nation, conceived in liberty and dedicated to the proposition that all men are created equal. Now we are engaged in a great civil war, testing whether that nation or any nation so conceived and so dedicated can long endure. Next slide please. We are met on a great battlefield of that war. We have come to dedicate a portion of that field as a final resting place for those who here gave their lives that that nation might live. It is altogether fitting and proper that we should do this. But in a larger sense, we cannot dedicate, we cannot consecrate, we cannot hallow this ground. The brave men, living and dead who struggled here have consecrated it far above our poor power to add or detract. Next slide please. The world will little note nor long remember what we say here, but it can never forget what they did here. It is for us the living rather to be dedicated here to the unfinished work which they who fought here have thus far so*

*nobly advanced. It is rather for us to be here dedicated to the great task remaining before us—that from these honored dead we take increased devotion to that cause for which they gave the last full measure of devotion, that we here highly resolve that these dead shall not have died in vain, that this nation under God shall have a new birth of freedom, and that government of the people, by the people, for the people, next slide please, shall not perish from the earth.*

This PowerPoint presentation was created by Peter Norvig; see [www.norvig.com](http://www.norvig.com). Norvig notes that these slides were quickly constructed by means of the PP “AutoContent Wizard.”

Just fancy that, “AutoContent.” In an essay in *The New Yorker* (May 28, 2001), Ian Parker describes the AutoContent Wizard as “a rare example of a product named in outright mockery of its target customers” (p. 76).

**Review of Key Objectives & Critical Success Factors**

- What makes nation unique
  - Conceived in Liberty
  - Men are equal
- Shared vision
  - New birth of freedom
  - Gov't of/for/by the people

**Not on Agenda!**

- Dedicate
- Consecrate
- Hallow (in narrow sense)
- Add or detract
- Note or remember what we say

**Summary**

- New nation
- Civil War
- Dedicate field
- Dedicated to unfinished work
- New birth of freedom
- Government not perish

## PowerPoint and Statistical Evidence

To investigate the performance of PP for statistical data, let us consider an important and intriguing table of cancer survival rates relative to those without cancer for the same time period. Some 196 numbers and 57 words describe survival rates and their standard errors for 24 cancers:

**Estimates of relative survival rates, by cancer site<sup>12</sup>**

	% survival rates and their standard errors							
	5 year		10 year		15 year		20 year	
Prostate	98.8	0.4	95.2	0.9	87.1	1.7	81.1	3.0
Thyroid	96.0	0.8	95.8	1.2	94.0	1.6	95.4	2.1
Testis	94.7	1.1	94.0	1.3	91.1	1.8	88.2	2.3
Melanomas	89.0	0.8	86.7	1.1	83.5	1.5	82.8	1.9
Breast	86.4	0.4	78.3	0.6	71.3	0.7	65.0	1.0
Hodgkin's disease	85.1	1.7	79.8	2.0	73.8	2.4	67.1	2.8
Corpus uteri, uterus	84.3	1.0	83.2	1.3	80.8	1.7	79.2	2.0
Urinary, bladder	82.1	1.0	76.2	1.4	70.3	1.9	67.9	2.4
Cervix, uteri	70.5	1.6	64.1	1.8	62.8	2.1	60.0	2.4
Larynx	68.8	2.1	56.7	2.5	45.8	2.8	37.8	3.1
Rectum	62.6	1.2	55.2	1.4	51.8	1.8	49.2	2.3
Kidney, renal pelvis	61.8	1.3	54.4	1.6	49.8	2.0	47.3	2.6
Colon	61.7	0.8	55.4	1.0	53.9	1.2	52.3	1.6
Non-Hodgkin's	57.8	1.0	46.3	1.2	38.3	1.4	34.3	1.7
Oral cavity, pharynx	56.7	1.3	44.2	1.4	37.5	1.6	33.0	1.8
Ovary	55.0	1.3	49.3	1.6	49.9	1.9	49.6	2.4
Leukemia	42.5	1.2	32.4	1.3	29.7	1.5	26.2	1.7
Brain, nervous system	32.0	1.4	29.2	1.5	27.6	1.6	26.1	1.9
Multiple myeloma	29.5	1.6	12.7	1.5	7.0	1.3	4.8	1.5
Stomach	23.8	1.3	19.4	1.4	19.0	1.7	14.9	1.9
Lung and bronchus	15.0	0.4	10.6	0.4	8.1	0.4	6.5	0.4
Esophagus	14.2	1.4	7.9	1.3	7.7	1.6	5.4	2.0
Liver, bile duct	7.5	1.1	5.8	1.2	6.3	1.5	7.6	2.0
Pancreas	4.0	0.5	3.0	1.5	2.7	0.6	2.7	0.8

Applying the PowerPoint templates for statistical graphics to this nice straightforward table yields the analytical disasters on the facing page. "Sweet songs never last too long on broken radios," wrote John Prine. These PP default-designs cause the data to explode into 6 separate chaotic slides, consuming 2.9 times the area of the table. *Everything* is wrong with these smarmy, incoherent graphs: uncomparative, thin data-density, chartjunk, encoded legends, meaningless color, logotype branding, indifferent to content and evidence. Chartjunk is a clear sign of statistical stupidity; use these designs in your presentation, and your audience will quickly and correctly conclude that you don't know much about data and evidence.<sup>13</sup> Poking a finger into the eye of thought, these data graphics would turn into a nasty travesty if used for

<sup>12</sup> Redesigned table based on Hermann Brenner, "Long-term survival rates of cancer patients achieved by the end of the 20th century: a period analysis," *The Lancet*, 360 (October 12, 2002), 1131-1135. Brenner recalculates survival rates from data collected by the U.S. National Cancer Institute, 1973-1998, from the Surveillance, Epidemiology, and End Results Program.

<sup>13</sup> PP-style chartjunk occasionally shows up in graphics of evidence in scientific journals. Below, the clutter half-conceals thin data with some vibrating pyramids framed by an unintentional Necker illusion, as the 2 back planes optically flip to the front:

For such small data sets, usually a simple table will show the data more effectively than a graph, let alone a chartjunk graph. Source of graph: N. T. Kouchoukos, *et al.*, "Replacement of the Aortic Root with a Pulmonary Autograft in Children and Young Adults with Aortic-Valve Disease," *New England Journal of Medicine*, 330 (January 6, 1994), p. 4. On chartjunk, see Edward R. Tufte, *The Visual Display of Quantitative Information* (1983, 2001), chapter 5.

## I. Cancer Survival Rates

## II. Cancer Survival Rates

## IV. Cancer Survival Rates

## V. Cancer Survival Rates

## VI. Cancer Survival Rates

a serious purpose, such as cancer patients seeking to assess their survival chances. To deal with a product that messes up data with such systematic intensity must require an enormous insulation from statistical integrity and statistical reasoning by Microsoft PP executives and programmers, PP textbook writers, and presenters of such chartjunk.

The best way to show the cancer data is the original table with its good comparative structure and reporting of standard errors. And PP default graphics are not the way to see the data. Our table-graphic, however, does give something of a *visual idea* of time-gradients for survival for each cancer. Like the original table, every visual element in the graphic shows data. Slideware displays, in contrast, usually devote a majority of their space to things other than data.

## PowerPoint Stylesheets

The PP cognitive style is propagated by the templates, textbooks, stylesheets, and complete pitches available for purchase. Some corporations and government agencies *require* employees to use designated PPPhluff and presentation logo-wear. With their strict generic formats, these designer stylesheets serve only to enforce the limitations of PowerPoint, compromising the presenter, the content, and, ultimately, the audience.

Here we see a witless PP pitch on how to make a witless PP pitch. Prepared at the Harvard School of Public Health by the "Instructional Computing Facility," these templates are uninformed by the practices of scientific publication and the rich intellectual history of evidence and analysis in public health. The templates do, however, emulate the format of reading primers for 6 year-olds.

Jane said, "Here is a ball.  
See this blue ball, Sally.  
Do you want this ball?"

Sally said, "I want my ball.  
My ball is yellow.  
It is a big, pretty ball."

Instructional Computing Facility

### Guidelines for Preparing Slides

Instructional Computing  
Facility

Harvard School of Public Health

Stylesheet-makers often seek to leave *their* name on *your* show; "branding," as they say in the Marketing Department. In case you didn't notice, this presentation is from the "Instructional Computing Facility." But where are the names of the people responsible for this? No names appear on any of the 21 slides.

Instructional Computing Facility

### Use the 6 X 6 rule:

6 lines of text  
6 words per line

Harvard School of Public Health

This must be the Haiku Rule for formatting scientific lectures. At least we're not limited to 17 syllables per slide. Above this slide, the rule can be seen in action—in a first-grade reading primer. The stylesheet typography, distinctly unscientific, uses a capital X instead of a multiplication sign.

Instructional Computing Facility

### No More than One Topic per Slide

What about them Sox hey?

Harvard School of Public Health

But this breaks up the evidence into arbitrary fragments. Why aren't we seeing examples from actual scientific reports? What are the Sox (a rather parochial reference) doing here? The inept PP typography persists: strange over-active indents, oddly chosen initial caps, typographic orphans on 3 of 4 slides.

Instructional Computing Facility

### Outline Formats are Easier to Follow

Harvard School of Public Health

Why is this relevant to scientific presentations? Are there other principles than ease of following? Didn't the *Harvard Business Review* article indicate that bullet outlines corrupted thought? Text, imaging, and data for scientific presentations should be at the level of scientific journals, much *higher* resolution than speech.

## Instructional Computing Facility

## Use Simple Tables to Present Numbers

	Use Tables	For Your Numbers	But Not too Many
This row	10	90	100
This row	0.6	0.4	1
This row	1	2	3
That row	1	2	3

Try not to make footnotes too small

Harvard School of Public Health

The stylesheet goes on to victimize statistical data, the fundamental evidence of public health. The table shows 12 numbers which is lousy for science (or sports, or finance) but normal for PowerPoint.<sup>14</sup> Table design is a complex and intriguing matter in typographic work, but there is nothing thoughtful about the design here. The unsourced numbers are not properly aligned, the row and column labels are awful, the units of measurement not given. In this stylesheet, there lurks a casual, flippant, almost smirky attitude toward data. That attitude—*what counts are power and pitches, not truth and evidence*—also lurks within PowerPoint.

Consider now a real table. John Graunt's *Bills of Mortality* (1662) is the foundation work of public health, introducing scientific methods to medical and demographic data. Graunt calculated the first tables of life expectancy, compared different causes of death, and even discussed defects in the evidence. His renowned "Table of Casualties" (at right) shows 1,855 different counts of death from 1629 to 1659. How fortunate that Graunt did not have PowerPoint and the assistance of the Harvard School of Public Health Instructional Computing Facility. Their guidelines (above) imply the construction of 155 separate PowerPoint slides to show the data in Graunt's original table!

For tables, the analytical idea is to make comparisons. The number of possible pairwise comparisons in a table increases as the square of the number of cells.<sup>15</sup> In Graunt's table, 1,719,585 pairwise comparisons, of varying relevance to be sure, are within the eyespan of the inquiring mind. In contrast, the 155 tiny tables on 155 PP slides would offer only 10,230 pairwise comparisons, about 6 in 1,000 of those available in Graunt's original table. These PP tables would also block all sorts of interesting comparisons, such as time patterns over many years. What Graunt needs to do for his presentation at Harvard is simply to provide printed copies of his original table to everyone in the audience.

<sup>14</sup> Some 39 tables appear in our collection of 28 PP textbooks. These tables show an average (median) of 12 numbers each, which approaches the *Pravda* level. In contrast, sports and financial pages in newspapers routinely present tables with hundreds, even thousands of numbers. Below, we see a simple weather table from a newspaper. The Harvard School of Public Health claims that to show this information would require 31 separate PowerPoint slides!

<sup>15</sup> A table with  $n$  cells yields  $n(n-1)/2$  pairwise comparisons of cell entries.

John Graunt, *National and Political Observations mentioned in a following index, and made upon the Bills of Mortality. With reference to the Government, Religion, Trade, Growth, Ayre, Diseases, and the several Changes of the said City* (London, 1662). "The Table of Casualties" follows folio 74.

## Creeping PowerPoint: PP Slide Formats for Paper Reports and Computer Screens

In addition to outlining and accompanying a talk, PP slides often serve other functions—printed out on paper to make a report, attached to e-mails, posted on the internet. The PP slide format now shows up on paper and computer screen. These slides, especially those following ready-made templates, replicate and intensify all the problems of the PP cognitive style onto paper and computer screen. *Again the short-run convenience for the presenter (and for PowerPoint) comes at an enormous cost to the content and the audience.*

As those who have flipped through pages and pages and pages of printed out PP slides already know, such reports are physically thick and intellectually thin. Their resolution is remarkably low. The table at right compiles data comparing the information densities of one image-equivalent for books (one page), for the internet (one screen), and for PP (one slide). In terms of character density, printed reports in PP format typically perform at 2% to 10% of the typographic richness of nonfiction bestsellers! Looking from the top lines down to the bottom lines of the table, we see that a single printed page in the *Physicians' Desk Reference* shows more than 50 PP slide-equivalents of information.

People see, read, and think all the time at intensities vastly greater than those presented in printed PP reports. Instead of showing a long sequence of tiny information-fragments on slides, and instead of dumping those slides onto paper, report writers should have the courtesy to write a real report (which might also be handed out at a meeting) and address their readers as serious people. PP templates are a lazy and ridiculous way to format printed reports.

PP slides also format material on the internet. Presenters post their slides; then readers, if any, march through one slide after another on the computer screen. And you thought PP talks were incoherent. Popular news sites on the internet show 10 to 15 times more information on a computer screen than a typical PP slide posted on a computer screen. The shuttle Columbia reports prepared by Boeing, when sent around by e-mail in PP format, were running at information densities of 20% of news sites on the internet (table above right).

The PP slide format has probably the worst signal/noise ratio of any known method of communication on paper or computer screen. Extending PowerPoint to embrace paper and internet screens pollutes those display methods.

### CHARACTER COUNTS AND DENSITY PER PAGE-IMAGE

	CHARACTERS PER PAGE	DENSITY: CHARACTERS/IN <sup>2</sup>

### *Sequentiality of the Slide Format*

With information quickly appearing and disappearing, the slide transition is an event that attracts attention to the presentation's compositional methods. The slide serves up a small chunk of promptly vanishing information in a restless one-way sequence. It is not a contemplative analytical method; it is like television, or a movie with frequent random jump cuts. Sometimes quick chunks of thin data may be useful (flash-card memorizing), other times not (comparisons, links, explanations). *But formats, sequencing, and cognitive approach should be decided by the character of the content and what is to be explained, not by the limitations of the presentation technology.* The talk that accompanies PP slides may overcome the noise and clutter that results from slideville's arbitrary partitioning of data, but why disrupt the signal in the first place? And why should we need to recover from a technology that is supposed to help our presentations?

Obnoxious transitions and partitions occur not only slide-by-slide but also line-by-line. We have seen the problems with the bullet list. Worse is the method of line-by-line slow reveal (at right). Beginning with a title slide, the presenter unveils and reads aloud the single line on the slide, then reveals the next line, reads that aloud, on and on, as stupefied audience members impatiently await the end of the talk.

It is helpful to provide audience members with at least one mode of information that allows *them* to control the order and pace of learning—unlike slides and unlike talk. Paper handouts for talks will help provide a permanent record for review—again unlike projected images and talk. Another way to break free of low-resolution temporal comparisons is to show multiple slides, several images at once within the common view. Spatial parallelism takes advantage of our notable capacity to reason about multiple images that appear simultaneously within our eyespan. We are able to select, sort, edit, reconnoiter, review—ways of seeing quickened and sharpened by direct spatial adjacency of evidence.

Now and then the narrow bandwidth and relentless sequencing of slides are said to be virtues, a claim justified by loose reference to George Miller's classic 1956 paper "The Magical Number Seven, Plus or Minus Two." That essay reviews psychological experiments that discovered people had a hard time remembering more than about 7 unrelated pieces of really dull data all at once. These studies on memorizing nonsense then led some interface designers to conclude that only 7 items belong on a list or a slide, a conclusion that can only be reached by not reading Miller's paper. In fact the paper neither states nor implies rules for the amount of information to be shown in a presentation (except possibly for slides consisting of nonsense syllables that the audience must memorize and repeat back to a psychologist). Indeed, the deep point of Miller's work is to suggest strategies, such as placing information within a context, that help extend the reach of memory beyond tiny clumps of data.<sup>16</sup>

<sup>16</sup> George A. Miller, "The Magical Number Seven, Plus or Minus Two: Some Limits on Our Capacity for Processing Information," *Psychological Review*, 63 (1956), 81-97 (posted at [www.well.com/user/smalin/miller.html](http://www.well.com/user/smalin/miller.html)). At Williams College in September 2000, I saw George Miller give a superb presentation that used the optimal number of bullet points on the optimal number of slides—zero in both cases. Just a nice straightforward talk with a long narrative structure.

### *What to do about PowerPoint*

Imagine a widely used and expensive prescription drug that claimed to make us beautiful but didn't. Instead the drug had frequent, serious side effects: making us stupid, degrading the quality and credibility of our communication, turning us into bores, wasting our colleagues' time. These side effects, and the resulting unsatisfactory cost/benefit ratio, would rightly lead to a worldwide product recall.

### *Improving Our Presentations*

Presentations largely stand or fall depending on the quality, relevance, and integrity of the content. The way to make big improvements in a presentation is to get better content.

Designer formats will not salvage weak content. If your numbers are boring, then you've got the wrong numbers. If your words or images are not on point, making them dance in color won't make them relevant. Audience boredom is usually a content failure, not a decoration failure.

At a minimum, a presentation format should *do no harm* to content. Yet again and again we have seen that the PP cognitive style routinely disrupts, dominates, and trivializes content. PP presentations too often resemble the school play: very loud, very slow, and very simple.

The practical conclusions are clear. PowerPoint is a competent slide manager and projector for low-resolution materials. And that's about it. PP has some occasionally useful low-end design tools and way too many Phluff tools. No matter how beautiful your PP ready-made template is, it would be better if there were less of it. Never use PP templates for arraying words or numbers. Avoid elaborate hierarchies of bullet lists. Never read aloud from slides. Never use PP templates to format paper reports or web screens. Use PP as a projector for showing low-resolution color images, graphics, and videos that cannot be reproduced as printed handouts at a presentation.

Paper handouts at a talk can effectively show text, numbers, data graphics, images. Printed materials, which should largely replace PP, bring information transfer rates in presentations up to that of everyday material in newspapers, magazines, books, and internet screens. A useful paper size for handouts at presentations is 11 by 17 inches (28 by 43 cm), folded in half to make 4 pages. This piece of paper can show images with a resolution of 1,200 dpi and up to 60,000 characters of words and numbers, the content-equivalent of 50 to 250 typical PP slides of text and data. Thoughtfully planned handouts at your talk tell the audience that you are serious and precise; that you seek to leave traces and have consequences. And that you respect your audience.

In day-to-day practice, PowerPoint templates may improve 10% or 20% of all presentations by organizing inept, extremely disorganized speakers, at a cost of detectable intellectual damage to 80%. For statistical data, the damage levels approach dementia. Since about  $10^{10}$  to  $10^{11}$  PP slides (many using the templates) are made each year, that is a lot of harm to communication with colleagues. Or at least a big waste of time.

The damage is mitigated since meetings relying on the PP cognitive style may not matter all that much. By playing around with Phluff rather than providing information, *PowerPoint allows speakers to pretend that they are giving a real talk, and audiences to pretend that they are listening.* This prankish conspiracy against substance and thought should always provoke the question, *Why are we having this meeting?*

As a consumer of presentations, you should not trust speakers who rely on the PP cognitive style. It is likely that these speakers are simply serving up PowerPointPhluff to mask their lousy content, just as this massive tendentious pedestal in Budapest once served up Stalin-cult propaganda to orderly followers feigning attention.

Military parade, Stalin Square, Budapest, April 4, 1956. Photograph by AP/Wide World Photos.

# *Postscript: Questions That Have Been Asked*

The first printing of this essay, along with some brief excerpts in *Wired* magazine and at my website, provoked many comments and questions. Here are responses to the more important concerns.

*The problem is with presenters who misuse PowerPoint. PowerPoint is just a tool; why blame the software for bad presentations? When a carpenter makes a crooked cut, do we blame the saw? Just because some people do silly things in PP doesn't mean that PP has a problem; people do silly things in written reports also.*

This makes one good point: responsibility for poor presentations rests with the presenter. But it is more complicated than that. PP has a distinctive, definite, well-enforced, and widely-practiced cognitive style that is contrary to serious thinking. PP actively facilitates the making of lightweight presentations.

This essay reports evidence based on several thousand slides, 5 case studies, and extensive quantitative comparisons between PowerPoint and other methods of communicating information. The results are clear: *some methods of presentation are better than others. And PowerPoint is rarely a good method.* The Columbia Accident Investigation Board, in their analysis "Engineering by Viewgraph," also makes distinctions among methods of presentation:

At many points during its investigation, the Board was surprised to receive similar presentation slides [similar to the Boeing slide with all its problems] from NASA officials in place of technical reports. The Board views the endemic use of PowerPoint briefing slides instead of technical papers as an illustration of the problematic methods of technical communication at NASA.

In this question, the tool metaphor does not provide intellectual leverage. Some tools are better than others; some poor performances are the fault of the tool. Saying that the problem is with the user rather than the tool blames the victims of PP (audience, content, presenter).

Nearly all the evidence of the essay suggests that there is inherent defect in PowerPoint, unless one advances the entertaining alternative hypothesis that nearly all PP users are lightweights and nearly all users of other methods are not. This is not the case; PP has inherent defect.

*I work in a large bureaucracy and everyone uses PowerPoint. I have problems with PowerPoint but how can I possibly avoid it in my talks?*

Use PP only as a slide projector for a few detailed images. Provide everyone at the meeting with a substantial paper handout and talk your audience through the handout. And don't begin by saying "Today I won't be using PowerPoint." Rarely do we want to attract attention to the methodology of presentation; instead just give a nice straightforward talk accompanying the printed material.

*I've seen some very good presentations using PowerPoint. What about that?*

Many factors contribute to a successful presentation: most of all, excellent content clearly presented. A good speaker with good content can sometimes overcome PP's cognitive style (especially if PPPhuff, hierarchical bullet outlines, low resolution, and branding are avoided). But our evidence indicates that this rarely happens. And why should presenters have to work around the PP cognitive style? Giving a good presentation is difficult enough; we shouldn't have to fight all the time with PowerPoint also.

*Your essay is very critical and about what not to do. What about ways to give a good presentation?*

Well, I can recommend 3 books on how to present visual evidence! Lurking in this essay are in fact a good many practical ideas on how to give PowerPoint-free presentations. Specific advice on making public presentations is found in the third chapter of *Visual Explanations* and in the forum at [www.edwardtufte.com](http://www.edwardtufte.com).

*Are there any other slides worthy of the Gettysburg Address parody? Seen any really good bad slides lately?*

It will be difficult ever to outdo the bar chart showing minus 87 years (four score and seven years ago) in Gettysburg by Peter Norvig. But connoisseurs of the graphically preposterous have been deeply moved by a recent PP slide presented by a high-level government official to a high-level advisory council. This is a real graphic, not a parody. It invites farcical speculation that the proposed research seeks to distinguish between the Ptolemaic and Copernican hypotheses. After all, the Earth is shown at the center of the universe.

"NASA's Strategy for Human and Robotic Exploration," slide 11, Gary L. Martin, NASA Space Architect, June 10, 2003, presented to the NASA Advisory Council.
